The hi-fidelity prototype is similar to a version I had made in a past assignment, but I spaced out the information in each row a little more, added a feature where the current order is shown next to where the user can edit the order instead of them being the same value, and I added a specific button to change the order information so the user is less likely to enter the wrong information for an item by accident. I also changed the color scheme to reflect the scheme I chose in my HTML implementation.
